Figure 2.1. FCC

2.1. Description

This model represents a flight control system for a helicopter that controls pitch attitude, roll attitude and yaw rate based on pilot inputs from the cyclic and pedals. The flight control computer also closes the loop on three hydrualic actuators and has sensor inputs from three Attitude/Heading Reference Systems.

2.3. Blocks

2.3.1. Parameters

2.3.1.1. "Act_Pos1" (Inport)

Table 2.16. "Act_Pos1" Parameters

Parameter	Value
Port number	1
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.001
Minimum	-32768
Maximum	32767
Data type	int16

2.3.1.2. "Act_Pos2" (Inport)

Table 2.17. "Act_Pos2" Parameters

Parameter	Value
Port number	2
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.001
Minimum	-32768
Maximum	32767
Data type	int16

2.3.1.3. "Act_Pos3" (Inport)

Table 2.18. "Act_Pos3" Parameters

Parameter	Value
Port number	3
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.001
Minimum	-32768
Maximum	32767
Data type	int16

2.3.1.4. "Actuator1" (Outport)

Table 2.19. "Actuator1" Parameters

Parameter	Value
Port number	1
Icon display	Port number
Minimum	
Maximum	
Data type	Inherit: auto
Lock output data ty- pe setting against changes by the fixe- d-point tools	off
Output as nonvirtual bus in parent model	off
Unit (e.g., m, m/s^2, N*m)	inherit
Port dimensions (-1 for inherited)	-1
Variable-size signal	Inherit
Sample time (-1 for inherited)	-1
Ensure outport is virtual	off
Source of initial output value	Dialog
Output when disabled	held

Parameter	Value
Initial output	
MustResolveToSigna- lObject	off
Specify output when source is unconnected	off
Constant value	0
Interpret vector parameters as 1-D	off

2.3.1.5. "Actuator2" (Outport)

Table 2.20. "Actuator2" Parameters

Parameter	Value
Port number	2
Icon display	Port number
Minimum	
Maximum	
Data type	Inherit: auto
Lock output data ty- pe setting against changes by the fixe- d-point tools	off
Output as nonvirtual bus in parent model	off
Unit (e.g., m, m/s^2, N*m)	inherit
Port dimensions (-1 for inherited)	-1
Variable-size signal	Inherit
Sample time (-1 for inherited)	-1
Ensure outport is virtual	off
Source of initial output value	Dialog
Output when disabled	held
Initial output	О
MustResolveToSigna- lObject	off

Parameter	Value
Specify output when source is unconnected	off
Constant value	0
Interpret vector parameters as 1-D	off

2.3.1.6. "Actuator3" (Outport)

Table 2.21. "Actuator3" Parameters

Parameter	Value
Port number	3
Icon display	Port number
Minimum	
Maximum	
Data type	Inherit: auto
Lock output data ty- pe setting against changes by the fixe- d-point tools	off
Output as nonvirtual bus in parent model	off
Unit (e.g., m, m/s^2, N*m)	inherit
Port dimensions (-1 for inherited)	-1
Variable-size signal	Inherit
Sample time (-1 for inherited)	-1
Ensure outport is virtual	off
Source of initial output value	Dialog
Output when disabled	held
Initial output	
MustResolveToSigna- lObject	off
Specify output when source is unconnected	off

Parameter	Value
Constant value	0
Interpret vector parameters as 1-D	off

2.3.1.7. "ActuatorControl1" (ModelReference)

Table 2.22. "ActuatorControl1" Parameters

Parameter	Value
Model name	ActuatorLoop
	ActuatorLoop.slx
	ActuatorLoop
Model arguments	Kp,Kd,Ki
Model argument values (for this instance)	Kd: '0.02' Ki: '0.12' Kp: '0.3'
Simulation mode	Normal
Show model initialize port	off
Show model reset ports	off
Show model terminate port	off
Show model periodic event ports	off
	on
Code interface	Model reference
Variant	off
Generate preprocess- or conditionals	off
Model argument values (for this instance)	0.3,0.02,0.12

2.3.1.8. "ActuatorControl2" (ModelReference)

Table 2.23. "ActuatorControl2" Parameters

Parameter	Value
Model name	ActuatorLoop
	ActuatorLoop.slx

Parameter	Value
	ActuatorLoop
Model arguments	Kp,Kd,Ki
Model argument values (for this instance)	Kd: '0.02' Ki: '0.12' Kp: '0.3'
Simulation mode	Normal
Show model initialize port	off
Show model reset ports	off
Show model terminate port	off
Show model periodic event ports	off
	on
Code interface	Model reference
Variant	off
Generate preprocess- or conditionals	off
Model argument values (for this instance)	0.3,0.02,0.12

2.3.1.9. "ActuatorControl3" (ModelReference)

Table 2.24. "ActuatorControl3" Parameters

Parameter	Value
Model name	ActuatorLoop
	ActuatorLoop.slx
	ActuatorLoop
Model arguments	Kp,Kd,Ki
Model argument values (for this instance)	Kd: '0.02' Ki: '0.12' Kp: '0.3'
Simulation mode	Normal
Show model initialize port	off
Show model reset ports	off
Show model terminate port	off

Parameter	Value
Show model periodic event ports	off
	on
Code interface	Model reference
Variant	off
Generate preprocess- or conditionals	off
Model argument values (for this instance)	

2.3.1.10. "AHRS1" (Inport)

Table 2.25. "AHRS1" Parameters

Parameter	Value
Port number	7
Port dimensions (-1 for inherited)	5
Sample time (-1 for inherited)	0.01
Minimum	-180
Maximum	180
Data type	double

2.3.1.11. "AHRS1_Valid" (Inport)

Table 2.26. "AHRS1_Valid" Parameters

Parameter	Value
Port number	10
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	0
Maximum	1
Data type	boolean

2.3.1.12. "AHRS2" (Inport)

Table 2.27. "AHRS2" Parameters

Parameter	Value
Port number	8
Port dimensions (-1 for inherited)	5
Sample time (-1 for inherited)	0.01
Minimum	-180
Maximum	180
Data type	double

2.3.1.13. "AHRS2_Valid" (Inport)

Table 2.28. "AHRS2_Valid" Parameters

Parameter	Value
Port number	11
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	0
Maximum	1
Data type	boolean

2.3.1.14. "AHRS3" (Inport)

Table 2.29. "AHRS3" Parameters

Parameter	Value
Port number	9
Port dimensions (-1 for inherited)	5
Sample time (-1 for inherited)	0.01
Minimum	-180
Maximum	180
Data type	double

2.3.1.15. "AHRS3_Valid" (Inport)

Table 2.30. "AHRS3_Valid" Parameters

Parameter	Value
Port number	12
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	0
Maximum	1
Data type	boolean

2.3.1.16. "Demux" (Demux)

Table 2.31. "Demux" Parameters

Parameter	Value
Number of outputs	3
Display option	bar
Bus selection mode	off

2.3.1.17. "Model" (ModelReference)

Table 2.32. "Model" Parameters

Parameter	Value
Model name	Heli_inner_loop
	Heli_inner_loop.slx
	Heli_inner_loop
Model argument values (for this instance)	struct with no fields.
Simulation mode	Normal
Show model initialize port	off
Show model reset ports	off
Show model terminate port	off
Show model periodic event ports	off

Parameter	Value
	on
Code interface	Model reference
Variant	off
Generate preprocess- or conditionals	off

2.3.1.18. "Model1" (ModelReference)

Table 2.33. "Model1" Parameters

Parameter	Value
Model name	Heli_outer_loop
	Heli_outer_loop.slx
	Heli_outer_loop
Model argument values (for this instance)	struct with no fields.
Simulation mode	Normal
Show model initialize port	off
Show model reset ports	off
Show model terminate port	off
Show model periodic event ports	off
	on
Code interface	Model reference
Variant	off
Generate preprocess- or conditionals	off

2.3.1.19. "Model2" (ModelReference)

Table 2.34. "Model2" Parameters

Parameter	Value
Model name	AHRS_voter
	AHRS_voter.slx
	AHRS_voter
Model argument values (for this instance)	struct with no fields.

Parameter	Value
Simulation mode	Normal
Show model initialize port	off
Show model reset ports	off
Show model terminate port	off
Show model periodic event ports	off
	on
Code interface	Model reference
Variant	off
Generate preprocess- or conditionals	off

2.3.1.20. "Pilot_phi_cmd" (Inport)

Table 2.35. "Pilot_phi_cmd" Parameters

Parameter	Value
Port number	5
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	-32768
Maximum	32767
Data type	int16

2.3.1.21. "Pilot_r_cmd" (Inport)

Table 2.36. "Pilot_r_cmd" Parameters

Parameter	Value
Port number	6
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	-32768
Maximum	32767

Parameter	Value
Data type	int16

2.3.1.22. "Pilot_theta_cmd" (Inport)

Table 2.37. "Pilot_theta_cmd" Parameters

Parameter	Value
Port number	4
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	-32768
Maximum	32767
Data type	int16

2.3.1.23. "RateTransition1" (RateTransition)

Table 2.38. "RateTransition1" Parameters

Parameter	Value
Ensure data integrity during data transfer	on
Ensure deterministic data transfer (maximum delay)	on
Initial conditions	0
Output port sample time options	Specify
Sample time multiple(>0)	1
Output port sample time	0.001

2.3.1.24. "RateTransition2" (RateTransition)

Table 2.39. "RateTransition2" Parameters

Parameter	Value
Ensure data integrity during data transfer	on

Parameter	Value
Ensure deterministic data transfer (maximum delay)	on
Initial conditions	0
Output port sample time options	Specify
Sample time multiple(>0)	1
Output port sample time	0.001

2.3.1.25. "RateTransition3" (RateTransition)

Table 2.40. "RateTransition3" Parameters

Parameter	Value
Ensure data integrity during data transfer	on
Ensure deterministic data transfer (maximum delay)	on
Initial conditions	0
Output port sample time options	Specify
Sample time multiple(>0)	1
Output port sample time	0.001

2.3.1.26. "Scaling" (Gain)

Table 2.41. "Scaling" Parameters

Parameter	Value
Gain	2*15/32767
Multiplication	Element-wise(K.*u)
Parameter minimum	
Parameter maximum	
Parameter data type	Inherit: Inherit via internal rule
Output minimum	
Output maximum	
Output data type	Inherit: Inherit via internal rule

Parameter	Value
Lock output data ty- pe setting against changes by the fixe- d-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Sample time (-1 for inherited)	-1

2.3.1.27. "Scaling1" (Gain)

Output minimum	
Output maximum	
Output data type	int16
Lock output data ty- pe setting against changes by the fixe- d-point tools	off
Input and output to have equal	Real World Value (RWV)
Integer rounding mode	Floor
Saturate on integer overflow	off
Sample time (-1 for inherited)	-1

2.3.1.43. "TypeConversion8" (DataTypeConversion)

Table 2.58. "TypeConversion8" Parameters

Parameter	Value
Output minimum	

Parameter	Value
Output maximum	
Output data type	int16
Lock output data ty- pe setting against changes by the fixe- d-point tools	off
Input and output to have equal	Real World Value (RWV)
Integer rounding mo- de	Floor
Saturate on integer overflow	off
Sample time (-1 for inherited)	-1

2.3.1.44. "UnitDelay" (UnitDelay)

Table 2.59. "UnitDelay" Parameters

Parameter	Value
Initial condition	0
Input processing	Elements as channels (sample based)
Sample time (-1 for inherited)	-1
State name must resolve to Simulink signal object	

2.3.2. Block Execution Order

"FCC" is a multitasking model. Block execution order is not available for multitasking models.

Chapter 3. Subsystems

Chapter 4. Requirements

Table of Contents

4.1. Model Information for "FCC"	29
4.2. Document Summary for "FCC"	29
4.3. System - FCC	

4.1. Model Information for "FCC"

Failed to get RMI data for HeliLibrary/InnerLoopFilter. Library "HeliLibrary" is not loaded.

Failed to get RMI data for HeliLibrary/InnerLoopFilter. Library "HeliLibrary" is not loaded.

Failed to get RMI data for HeliLibrary/InnerLoopFilter. Library "HeliLibrary" is not loaded.

Chapter 6. Glossary

Atomic Subsystem. A subsystem treated as a unit by an implementation of the design documented in this report. The implementation computes the outputs of all the blocks in the atomic subsystem before computing the next block in the parent system's block execution order (sorted list).

Block Diagram. A Simulink block diagram represents a set of simultaneous equations that relate a system or subsystem's inputs to its outputs as a function of time. Each block in the diagram represents an equation of the form y = f(t, x, u) where t is the current time, u is a block input, y is a block output, and x is a system state (see the Simulink documentation for information on the functions represented by the various types of blocks that make up the diagram). Lines connecting the blocks represent dependencies among the blocks, i.e., inputs whose current values are the outputs of other blocks. An implementation of a design described in this document computes a root or atomic system's outputs at each time step by computing the outputs of the blocks in an order determined by block input/output dependencies.

Block Parameter. A variable that determines the output of a block along with its inputs, for example, the gain parameter of a Gain block.

Block Execution Order. The order in which Simulink evaluates blocks during simulation of a model. The block execution order determined by Simulink ensures that a block executes only after all blocks on whose outputs it depends are executed.

Checksum. A number that indicates whether different versions of a model or atomic subsystem differ functionally or only cosmetically. Different checksums for different versions of the same model or subsystem indicate that the versions differ functionally.

Design Variable. A symbolic (MATLAB) variable or expression used as the value of a block parameter. Design variables allow the behavior of the model to be altered by altering the value of the design variable.

Signal. A block output, so-called because block outputs typically vary with time.

Virtual Subsystem. A subsystem that is purely graphical, i.e., is intended to reduce the visual complexity of the block diagram of which it is a subsystem. An implementation of the design treats the blocks in the subsystem as part of the first nonvirtual ancestor of the virtual subsystem (see Atomic Subsystem).

Chapter 7. About this Report

Table of Contents

7.1. Report Overview	69
7.2. Root System Description	69
7.3. Subsystem Descriptions	
7.4. State Chart Descriptions	

7.1. Report Overview

This report describes the design of the FCC system. The report was generated automatically from a Simulink model used to validate the design. It contains the following sections:

Model Version. Specifies information about the version of the model from which this design description was generated. Includes the model checksum, a number that indicates whether different versions of the model differ functionally or only cosmetically. Different checksums for different versions indicate that the versions differ functionally.

Root System. Describes the design's root system.

Subsystems. Describes each of the design's subsystems.

Design Variables. Describes system design variables, i.e., MATLAB variables and expressions used as block parameter values.

System Model Configuration. Lists the configuration parameters, e.g., start and stop time, of the model used to simulate the system described by this report.

Requirements. Shows design requirements associated with elements of the design model. This section appears only if the design model contains requirements links.

Glossary. Defines Simulink terms used in this report.

7.2. Root System Description

This section describes a design's root system. It contains the following sections:

Diagram. Simulink block diagram that represents the algorithm used to compute the root system's outputs.

Description. Description of the root system. This section appears only if the model's root system has a Documentation property or a Doc block.

Interface. Name, data type, width, and other properties of the root system's input and output signals. The number of the block port that outputs the signal appears in angle brackets appended to the signal name. This section appears only if the root system has input or output ports.

Blocks. This section has two subsections:

- **Parameters.** Describes key parameters of blocks in the root system. This section also includes graphical and/or tabular representations of lookup table data used by lookup table blocks, i.e., blocks that use lookup tables to compute their outputs.
- **Block Execution Order.** Order in which blocks must be executed at each time step in order to ensure that each block's inputs are available when it executes.

State Charts. Describes state charts used in the root system. This section appears only if the root system contains Stateflow blocks.

7.3. Subsystem Descriptions

This section describes a design's subsystems. Each subsystem description contains the following sections:

Checksum. This section appears only if the subsystem is an atomic subsystem. The checksum indicates whether the version of the model subsystem used to generate this report differs functionally from other versions of the model subsystem. If two model checksums differ, the corresponding versions of the model differ functionally.

Diagram. Simulink block diagram that graphically represents the algorithm used to compute the subsystem's outputs.

Description. Description of the subsystem. This section appears only if the subsystem has a Documentation property or contains a Doc block.

Interface. Name, data type, width, and other properties of the subsystem's input and output signals. The number of the block port that outputs the signal appears in angle brackets appended to the signal name. This section appears only if the subsystem is atomic and has input or output ports.

Blocks. Blocks that this subsystem contains. This section has two subsections:

- **Parameters.** Key parameters of blocks in the subsystem. This section also includes graphical and/or tabular representations of lookup table data used by lookup table blocks, blocks that use lookup tables to compute their outputs.
- **Block Execution Order.** Order in which the subsystem's blocks must be executed at each time step in order to ensure that each block's inputs are available when the block executes .This section appears only if the subsystem is atomic. Note: in Acrobat(PDF) reports, the number in square brackets next to the block name is a hyperlink to the block parameter table. The number has no model significance.

State Charts. Describes state charts used in the subsystem. This section appears only if the root system contains Stateflow blocks.

7.4. State Chart Descriptions

This section describes the state machines used by Stateflow blocks to compute their outputs, i.e., Stateflow blocks. Each state machine description contains the following sections:

Chart. Diagram representing the state machine.

States. Describes the state machine's states. Each state description includes the state's diagram and diagrams and/or descriptions of graphical functions, Simulink functions, truth tables, and MATLAB functions parented by the state.

Transitions. Transitions between the state machine's states. Each transition description specifies the values of key transition properties. Appears only if a transition has properties that do not appear on the chart.

Junctions. Transition junctions. Each junction description specifies the values of key junction properties. Appears only if a junction has properties that do not appear on the chart.

Events. Events that trigger state transitions. Each event description specifies the values of key event properties.

Data. Data types and other properties of the Stateflow block's inputs, outputs, and other state machine data.

Targets. Executable implementations of the state machine used to compute the outputs of the corresponding Stateflow block.

MATLAB Supporting Functions. List of functions invoked by MATLAB functions defined in the chart.
